

## Relieve ergonomic knives

Relieve knives are designed for people with impaired mobility in their hands and arms. The angle of the handle allows the user to keep the wrist straight, thus making efficient use of the strength in the hand and arm.

## Relieve angled carving knife

The handle is ergonomically designed and angled to allow the user to exert the most force when cutting food while standing up. The blade has a sharp edge so that cutting is easy and requires little force.

## Relieve angled knives

The angled table knives also have ergonomically designed handles, but these are angled to allow the user to exert the most force when cutting food while sitting down. These knives are available in three variants: for normal-sized hands, for small hands or children's hands, and a folding version which is easy to bring.

## Relieve adjustable knife

The adjustable knife is designed for people with weak hands and impaired grip. This knife has an adjustable handle which allows the user to support the grip with the other hand when cutting. This handle is adjustable so there are many different grips that can be used, making this knife easy to adapt to individual users' hands.

Relieve adjustable knife

## Kitchen knives

Compared with ordinary kitchen knives, these knives permit a better working position for hands and wrists. They balance well in the hand and require no additional force to keep the blade up. Since the wrist is held straight to grip, the strength in the hand and arm is used in the best way. These knives are available with two different blades, one smooth and one serrated.
